CANINE DENTAL DISCHARGE INSTRUCTIONS

DATE: _____	DOCTOR: <input type="checkbox"/> Tejinder Sodhi
PATIENT: _____ Gender : _____	<input type="checkbox"/> Raja Velu
	<input type="checkbox"/> _____

Your dog has just had his teeth cleaned to remove tartar and bacteria from the teeth and under the gums. Where necessary, any loose or diseased teeth may have been extracted. After the cleaning, the teeth were thoroughly polished to remove plaque from the surface of the teeth. The last step was to apply fluoride to protect the surface of the enamel. As a hygienist regularly cleans your own teeth, your dog may need regular cleanings to ensure the continued health of his teeth and gums.

In order to do a thorough and safe cleaning, your dog was put under general anesthesia. You may find shaved areas on your dog where an IV catheter and various sensors were placed. These allowed us to constantly monitor heart rate, respiratory rate, oxygen saturation and blood pressure. These safeguards allow us to adjust the anesthesia properly for each individual pet. The hair should begin to re-grow within a few weeks. Some dogs experience slight throat irritation from the endotracheal tube used to administer anesthesia and oxygen. Your dog may cough at home occasionally for one to three days. If coughing is excessive or prolonged, please call us for further instructions.

When your dog goes home, he may still be groggy and could easily fall from a sofa or down stairs. Care at home mainly entails restriction of activity to prevent any injuries. If your dog is to be left alone, he must be confined to a cage or other small area (such as child's playpen or a shower stall) and kept away from other pets. This strict confinement must be continued until your dog behaves normally, which may take until late evening or the next morning. You may feed your dog a small meal when you take him home (we recommend no more than one third of the amount of food). Keep water readily available. Do not be alarmed if your dog does not feel like eating, but his appetite should return by morning. If your pet vomits after eating, do not give him any more food until the next morning. If extractions were done, we advise feeding canned food (or dry food softened with water) for a few days. If periodontal disease was present and your dog is on antibiotics, please continue the medication for the full time prescribed.

If your pet has teeth extraction. There are dissolvable suture in the mouth. Expect some blood tinged saliva and inflammation. Any unusual bleed or swelling please notify us immediately.

Now that your pet's teeth are clean you can help them stay that way. Some dogs will allow you to brush their teeth while others will not. There are a variety of pet toothbrushes available, and we will be happy to help you find the right one. Pet toothpastes are available in a variety of flavors, we do not recommend human toothpaste. We also recommend oral gels and wipes, as some people find these easier to use than brushes. We recommend that you clean your dog's teeth as often as possible. Tartar control food and treats are also helpful.

Even with daily care, tartar may still form which would necessitate periodic professional cleaning. Some of the signs of unhealthy teeth and gums are: bad breath, difficulty eating and chewing, red, inflamed gums, or not wanting to eat at all. If any of these signs occur please let us know. Dental disease allows bacteria to spread from the mouth through the blood stream to all the organs in the body. The heart, kidneys, or the liver can be seriously affected by this bacterial spread, and disease in any of these organs can be fatal to your pet. Our goal is to help your dog maintain good health, which includes good oral health for its entire life.

If you have questions or concerns during your pet's recovery, please do not hesitate to call our office at (425) 771-6300.

If you need advice after hours, please call the emergency clinics following the list below	
VCA Veterinary Specialty Center of Seattle	(425) 697-6106
ACCES-Animal Critical Care & Emergency Clinic	(206) 364-1660
Animal Medical Center of Seattle	(206) 204-3366
